# **Medical Coverage Policy |** Ovarian and Internal Iliac Vein Embolization as a Treatment of Pelvic Congestion Syndrome

**EFFECTIVE DATE:** 12 | 01 | 2014

**POLICY LAST UPDATED:** 09 | 21 | 2022

### **OVERVIEW**

Pelvic congestion syndrome is characterized by chronic pelvic pain that is often aggravated by standing; diagnostic criteria for this condition are not well-defined. Endovascular occlusion (eg, embolization, sclerotherapy) of the ovarian and internal iliac veins has been proposed as a treatment for patients who fail medical therapy.

### **MEDICAL CRITERIA**

Not applicable

# **PRIOR AUTHORIZATION**

Not applicable

### **POLICY STATEMENT**

# Medicare Advantage Plans

Embolization of the ovarian vein and internal iliac veins is considered not covered as a treatment of pelvic congestion syndrome as the evidence is insufficient to determine the effects of the technology on health outcomes.

# **Commercial Products**

Embolization of the ovarian vein and internal iliac veins is considered not medically necessary as a treatment of pelvic congestion syndrome as the evidence is insufficient to determine the effects of the technology on health outcomes.

# **COVERAGE**

Benefits may vary between groups and contracts. Please refer to the appropriate Benefit Book, Evidence of Coverage or Subscriber Agreement for applicable not medically necessary/not covered benefits/coverage.

# **BACKGROUND**

Pelvic congestion syndrome is characterized by chronic pelvic pain that is often aggravated by standing; diagnostic criteria for this condition are not well-defined. Embolization of the ovarian and internal iliac veins has been proposed as a treatment for patients who fail medical therapy.

For individuals who have pelvic congestion syndrome who receive ovarian and/or internal iliac vein embolization, the evidence includes case series and a systematic review. Relevant outcomes are symptoms and treatment-related morbidity. According to a systematic review of case series data, approximately 80% of patients have reported some degree of symptom relief 12 months after ovarian and/or internal iliac vein embolization. It is difficult to draw conclusions from these data because of a lack of a placebo control or comparative data from alternative interventions. Moreover, definitions of pelvic congestion syndrome vary, making it challenging to clearly define a patient population with symptoms arising from pelvic congestion. Randomized controlled trials using well-defined eligibility criteria are needed. The evidence is insufficient to determine the effects of the technology on health outcomes, thus the treatment is considered not medically necessary.

### CODING

The following CPT code(s) is not covered for Medicare Advantage Plans and not medically necessary for Commercial Products when filed with the ICD-10 Diagnosis Code(s) listed below:

Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary complete the intervention; venous, other than hemorrhage (e.g., congenital or acquired venous malformations, venous and capillary hemangiomas, varices, varicoceles)

\*ICD-10 Diagnosis Code: N94.89
