

Medical Coverage Policy | Venipuncture for State Mandated Lead Screening

EFFECTIVE DATE: 09|01|2003
POLICY LAST UPDATED: 07|03|2018

OVERVIEW

This policy addresses state mandated coverage guidelines for the venipuncture for blood specimen collection to be sent to a state-approved laboratory for lead screening (Rhode Island General Law 23-24.6-9).

MEDICAL CRITERIA

Not applicable

PRIOR AUTHORIZATION

Prior Authorization is not required.

POLICY STATEMENT

Commercial Products

Venipuncture for blood specimen collection for lead testing is covered and separately reimbursed when filed with a -32 modifier.

BlueCHiP for Medicare

Not applicable

Rhode Island-mandated benefits generally do not apply to BlueCHiP for Medicare members. This mandate is for children under age 6 who are not eligible for Medicare.

COVERAGE

Benefits may vary between groups/contracts. Please refer to the appropriate Benefit Booklet, Evidence of Coverage, or Subscriber Agreement for applicable physician services/lab coverage/benefits.

BACKGROUND

Lead is a heavy gray metal that has many uses and can be harmful if it gets into the body. Before 1978, lead was used to make paint. Many old houses are painted with lead-based paint.

Lead can get into the body in various ways, including by ingesting or breathing dust from lead paint, ingesting lead chips, drinking tap water that has lead in it, eating fruits or vegetables that have lead on them from the soil, and eating food that has been prepared or stored in dishes made with lead.

Lead can be found in many places around a home, such as in peeling and chipping lead paint, dust from lead paint, soil and dirt in the yard, tap water from lead pipes, and pottery, crystal, or ceramic dishes. The most prevalent exposure in Rhode Island comes from lead-based paint and paint dust found in residences built before 1978.

Lead is most dangerous to children younger than six years old. Young children put their hands, toys and other things in their mouths. Any of these objects could have lead dust on them. Lead poisoned children are likely to suffer life-long consequences. Even a small amount of lead can have a negative effect on a child's

development and can cause serious health problems, including learning disabilities, loss of IQ, and reduced attention span.

According to the American Academy of Pediatrics, one million U.S. children have elevated lead levels in their blood. Even low levels of lead can cause a range of chronic conditions, including everything from anemia, hearing loss, and kidney problems, to physical and developmental delays; severe exposure to lead can cause seizures, coma, and even death.

Some states require pediatricians to regularly screen children under age three for lead exposure; however, many states do not. Lead poisoning is an environmental problem that can be prevented and treated. Often, however, exposure to lead goes undetected until the child's physical or developmental symptoms are evident.

Developmental delays and behavioral problems can be a symptom of lead poisoning. A child who mouths many objects, or may put non-food items in the mouth, may be at risk of lead poisoning. Because of the range of risks involved, lead screenings are routinely performed when a child shows the signs of a developmental delay or disorder. This screening should be conducted immediately in order to rule out lead poisoning and, if detected, to minimize the negative effects of lead exposure.

A lead screening is conducted by a simple blood test. A health professional may complete this test with a finger prick or by taking blood from a vein. Generally, physicians prefer to test blood from a vein in a child's arm. If a stick test shows a significant elevation of lead levels in a child's blood, another sample will be taken from the child's vein to confirm the results.

Lead exposure may come from a number of sources, as detailed by the following list from the Centers for Disease Control and Prevention (CDC):

- Lead-based paint in older homes that is deteriorating, creating dust and paint chips easily ingested by young children.
- Lead-based paint in homes that is disturbed during renovation or remodeling.
- Lead-based paint in homes that is exposed, on a surface easily chewed by a young child (such as a window sill).
- Lead-contaminated soil.
- Operating or abandoned industrial sites and smelters. Although lead pollution has been greatly reduced, some soil and dust contamination can still result.
- Occupations and hobbies. Children can be exposed to lead-contaminated dust on parents' clothes.
- Use of lead-containing ceramics for cooking, eating or drinking.
- Use of traditional home remedies or cosmetics that contain lead.

§ 23-24.6-9 Reimbursement by third party payers. – *Screening for lead poisoning and lead screening related services for children under six (6) years of age as required by department regulations and diagnostic evaluations for lead poisoning for children under six (6) years of age, including but not limited to confirmatory blood lead testing, shall be a covered health benefit and be reimbursable under any general or blanket policy of accident or health insurance offered by an insurer except for supplemental policies which only provide coverage for specific diseases, hospital indemnity Medicare supplements, or other supplemental policies. The department of human services shall pay for the lead screening and lead screening related and diagnostic evaluation services where the patient is eligible for medical assistance under the provisions of chapter 8 of title 40. The department of health shall pay for the lead screening and lead screening related and diagnostic evaluation services where the patient is not covered by any health insurance. All companies which are self insured for health care services will be encouraged by the department to participate as other insurers.*

CODING

Commercial Products

The following codes are covered:

36415-32 Collection of venous blood by venipuncture

36416-32 Collection of capillary blood specimen (eg, finger, heel, ear stick)
