**Medical Coverage Policy** | Interspinous and Interlaminar Stabilization/Distraction Devices (Spacers)

**EFFECTIVE DATE:** 03 | 01 | 2018 **POLICY LAST UPDATED:** 11 | 21 | 2017

### **OVERVIEW**

Interspinous and interlaminar implants (spacers) stabilize or distract the adjacent lamina and/or spinous processes and restrict extension to reduce pain in patients with lumbar spinal stenosis and neurogenic claudication. Interspinous spacers are small devices implanted between the vertebral spinous processes. After implantation, the device is opened or expanded to distract (open) the neural foramen and decompress the nerves. Interlaminar spacers are implanted midline between adjacent lamina and spinous processes to provide dynamic stabilization either following decompressive surgery or as an alternative to decompressive surgery.

### **MEDICAL CRITERIA**

Not applicable

### **PRIOR AUTHORIZATION**

**BlueCHiP** for Medicare and Commercial Products Not applicable

### **POLICY STATEMENT**

## BlueCHiP for Medicare and Commercial Products

Interspinous distraction devices as a treatment of neurogenic intermittent claudication and use of an interlaminar stabilization device following decompressive surgery are considered **not medically necessary** as the evidence is insufficient to determine the effects of the technology on health outcomes.

**Removal for medical reasons** (device failure, infection, etc.) is covered for all members. However, insertion of a replacement device after removal is not covered for Commercial members, as the insertion is considered not medically necessary.

## **COVERAGE**

Benefits may vary between groups/contracts. Please refer to the appropriate Benefit Booklet, Evidence of Coverage or Subscriber Agreement for limitations of benefits/coverage for applicable surgery or when services are not medically necessary.

#### **BACKGROUND**

Interspinous spacers are devices implanted between vertebral spinous processes. Interlaminar spacers are implanted between adjacent lamina and have 2 sets of wings placed around the inferior and superior spinous processes. These implants aim to restrict painful motion while otherwise enabling normal motion. The devices (spacers) distract the laminar space and/or spinous processes and restrict extension. This procedure theoretically enlarges the neural foramen and decompresses the cauda equina in patients with spinal stenosis and neurogenic claudication. Other types of dynamic posterior stabilization devices are pedicle screw/rod-based devices and total facet replacement systems; these are not covered in this policy.

One type of interspinous implant is inserted between the spinous processes through a small (4-8 cm) incision and acts as a spacer between the spinous processes, maintaining the flexion of that spinal interspace. The supraspinous ligament is maintained and assists in holding the implant in place. The surgery does not include

any laminotomy, laminectomy, or foraminotomy at the time of insertion, thus reducing the risk of epidural scarring and cerebrospinal fluid leakage. Other interspinous spacers require removal of the interspinous ligament and are secured around the upper and lower spinous processes. Interlaminar implants are inserted between the adjacent lamina and spinous processes. These may be referred to as interlaminar implants or an interspinous U.

The evidence for an interspinous or interlaminar spacer as a stand-alone procedure in individuals who have spinal stenosis and for interlaminar spacers in individuals who have spinal decompression surgery for spinal stenosis is insufficient to determine the effects of the technology on health outcomes. Therefore, the devices are considered not medically necessary.

## **CODING**

#### BlueCHiP for Medicare and Commercial Products

The following codes are considered not medically necessary:

22867 Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level

22868 Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; second level (list separately in addition to code for primary procedure)

22869 Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level

22870 Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; second level (list separately in addition to code for primary procedure)

This medical policy is made available to you for informational purposes only. It is not a guarantee of payment or a substitute for your medical judgment in the treatment of your patients. Benefits and eligibility are determined by the member's subscriber agreement or member certificate and/or the employer agreement, and those documents will supersede the provisions of this medical policy. For information on member-specific benefits, call the provider call center. If you provide services to a member which are determined to not be medically necessary (or in some cases medically necessary services which are non-covered benefits), you may not charge the member for the services unless you have informed the member and they have agreed in writing in advance to continue with the treatment at their own expense. Please refer to your participation agreement(s) for the applicable provisions. This policy is current at the time of publication; however, medical practices, technology, and knowledge are constantly changing. BCBSRI reserves the right to review and revise this policy for any reason and at any time, with or without notice.
